Capillary-type rotation viscometer. K. F. Zhigach and D. B. Zhigach (Leningrad Petroleum Inst., Moscow). *Zhurnal Khim. Fiz.* 18, 642-7 (1949).—Detailed description is given of a viscometer suitable for rates of shear from 0.1 to 1000 sec.⁻¹ with the speed of rotation of the outer cone accurately variable from 0 to 800 r.p.m. For liquids with a viscosity η of the order of 0.01 poise, proportionality between the moment and the speed of rotation, up to 1000 sec.⁻¹, obtains with a clearance between the inner and the outer cone, $d = 0.2$ –1.0 mm.; with liquids with $\eta \sim 0.04$, the crit. d of turbulence is 2 mm., and with high- η liquids (0.2 poise) the proportionality holds at any d . The app. needs to be calibrated for a given d with a liquid of known η . Measurements are carried out by turning continuously.

(over)

the speed of rotation at a given ω , d , then repeating it at ever smaller d . The set of the linear portions of the speed of rotation (ω)-angle of torsion (α) curves, gives the plastic viscosity. The Bingham shearing stress is given by the intercepts detd. by extrapolation of the linear portions. The apparent effective viscosity is given by $\eta = K\omega/\alpha$, where K is a const. of the app. at the given d . The dynamic limiting shearing stress is $\tau_0 = \alpha N/SN$, where N = modulus of torsion of the wire, S = lateral surface area of the wire-predicted cone, R = its effective radius. N . Then

Structural viscous properties of colloidal clay suspensions. K. F. Zilgach and D. R. Zlatnik (All-Union Petroleum Research Inst.). *Doklady Akad. Nauk S.S.S.R.* 72, 627-630 (1950). -- Curves of the speed of rotation (r.p.m.) against the angle of torsion detd. with thixotropic low-concn. (3-7%) aq. suspensions of bentonitic and subbentonitic clays, in a conical-type rotation viscometer with different (0.20-0.02 cm.) clearances Δr between the outer and the inner cone, pass through a common point M_1 on the axis of abscissas, not through the origin. The plots are curvilinear at low speeds of rotation, becoming rectilinear at greater speeds. Extrapolation of the rectilinear portions to intersection with the axis of abscissas gives an intercept M_1 , proportional to Bingham's shearing stress θ . The intercept detd. by the intersection

of the axis of abscissas and the perpendicular at the point of tangency linearly, gives Hagenbach's upper limit M_2 . Contrary to the theoretically predicted decrease of M_1/M_2 with decreasing Δr , this difference actually increases with Δr decreasing from 0.20 to 0.02 cm. Consequently, of the 3 magnitudes M_1 , M_2 , and M_3 , only the lowermost, M_1 , the only one to be independent of Δr , has real significance as a characteristic of the structured liquid. This parameter termed the dynamic limiting shearing stress θ_d expresses the strength of the residual structure at which viscous flow begins, or of the structure almost instantaneously restored after perturbation. On the other hand, the strength of the thixotropic structure, characterized by the static shearing stress θ_s , depends on the length of the rest period. The dynamic θ_d is equal to the min. θ , corresponding to an infinitely short rest period; under any conditions, θ_d is not greater than θ_s . The simple Bingham-Goodwin equation $\eta_0 = \eta_s + \theta/\dot{\gamma}$ (where $\eta = \dot{\gamma}/d\dot{\gamma}$) is applicable only in the range of low $\dot{\gamma}$ up to 30 sec.⁻¹; at high rates of shear, up to 1000 sec.⁻¹, θ and η_0 are no longer const., but θ increases and η_0 decreases with decreasing Δr and increasing $\dot{\gamma}$. However, in contrast to the plastic viscosity η_0 and to θ , the effective viscosity η_e , detd. as difference Δr , remains nearly const. in a wide range of $\dot{\gamma}$, approx. from 300 sec.⁻¹ upwards (up to about 1000 sec.⁻¹). That limiting const. η_e at high $\dot{\gamma}$ is an important characteristic of the flow of a structured liquid. In a capillary viscometer, θ decreases with increasing diam. of the capillary; η_0 increases, i.e., the variation with the diam. is analogous to the variation with Δr in a rotation viscometer.

AUTHOR: Znamenskiy, A.

SNV/92-58-12-23/24

TITLE: A Town of Oilmen in the North (Gorod neftyanikov Severa)

PERIODICAL: Neftyanik, 1958, Nr 12, pp 28-30 (USSR)

ABSTRACT: In examining a map of the Northern part of the Soviet Union the attention of everyone is attracted by the enormous size of the Komi ASSR, a region rich in forests, rivers, coal, petroleum, natural gas, oil shale, and fur. In the approximate center of this region, where the railroad crosses the Izhma River, there is a town of oilmen called Ukhta. In 1958 it celebrates its 15th anniversary. The author describes unsuccessful attempts to organize the region's petroleum production in prerevolutionary Russia. He maintains that all efforts made in this direction failed because of the unofficial intervention of Nobel, the Baku petroleum magnate who wanted to prevent the development of the region. At that time the Komi Region was almost impassable, and from 15 to 20 days were needed to reach the Ukhta River banks traveling by small boats along the Vym' River. Under these conditions the transportation of heavy rigs and equipment was altogether impossible. Nevertheless under Soviet rule the region has become vitalized and its wealth brought under control. When Baku was under the occupation of foreign troops in 1920, the first prospecting expedition was sent to the Ukhta Region by order of Lenin; it found that the region abounded in petroleum, gas,

Card 1/3

A Town of Oilmen in the North

SOV/92-58-12-23/24

asphaltite, oil, shale, etc. However, a systematic exploration of the region did not begin until the First Five Year Plan, at the same time as the construction of the first tractor plant near Stalingrad. That was the beginning of industrial activities at Ukhta. The conditions under which the first steps in this direction were made were extremely difficult since it was a "taiga" region. The first refinery and machine plants were later built at the site where the first borehole of the region had been drilled. Petroleum extracting mines were built 25 km from the town of Ukhta. The "black gold" is extracted there by mining, and petroleum deposits are visible to geologists and drillers. Large plants producing carbon black from natural gas were built at Ukhta. Natural gas and petroleum deposits were also discovered at Dzhebel, and it is expected that they will suffice to meet the requirements of the central Ural Region and Sverdlovsk. Dozens of schools, several recreational facilities, and libraries have now been opened in the town of Ukhta. Two technical schools train petroleum and railroad specialists. The article contains 6 photographs which show: (1) a general view of the Ukhta refinery, (2) the Oktyabr'skaya street in Ukhta and the Ukhtokombinat Administration building, (3) P.V. Makharadze, the operator of one of the Ukhta refinery processing units. (4) D.M. Makhinya, one of the best operators at the Ukhta refinery

Effect of moist wheat bread on animal organisms and the methods for its determination in flour and pastries. D. Zeleny. *Voprasy Pitaniya* 9, No. 4, 1953 204 (1953). In guinea pigs and rabbits no effects were noticed over 10 months but in rats there was a considerable retardation of growth. The present allowable 0.04% of wheat spores in flour causes darkening of the bread, is harmful and should be decreased as soon as possible. F. H. H.

TOPIC TAGS: photographic printing, microfilm, *OFFICE MACHINE, PRINTING MACHINERY*

ABSTRACT: Copying and reproducing machines manufactured by CEHA member nations (chiefly the USSR and Poland) are pictured and their technical parameters are given. In his criticism of a number of the machines displayed, the author mentioned: unstable temperature regime, the use of movie projection lamps instead of neon tubes, and high voltage requirements. The author urges the development of automated, high efficiency, compact machines for copying book pages and the development of special equipment for reproducing large blueprints up to 59 x 1680 mm. Orig. art. has: 7 figures, 1 table.

ABSTRACT: This patent certificate presents a reading-copying apparatus. The device
is designed for the automatic reading and copying of documents. It consists of a
reading unit, a copying unit, and a control unit. The reading unit is used for
reading the document and the copying unit is used for copying the document. The
control unit is used for controlling the reading and copying process. The device
is designed for the automatic reading and copying of documents. It consists of a

Periodical : Neft. Khoz., v. 32, #7, 89-91, J1 1954

Abstract : A general review of the Engineering Council's activities is outlined. The review concerns numerous papers presented on various subjects essential to the petroleum industry. The sessions of the council were held jointly with the Leningrad, Moscow and Baku branches of the Academy of Sciences and with local organizations studying the particular subject. The papers pertained to geological survey, underground gas storage adjacent to industrial plants, extensive use of artificial pressure in the stratum, exploratory drilling, classification of rocks and tools, study of displacement of liquid from a porous medium, improvement in technique and technology of petroleum products and

the Ministry of the Petroleum Industry of the USSR.

Periodical : Neft. khoz., v.32, #12, 88-90, D 1954

Abstract : Various subjects discussed in joint sessions of
the Technical Council, local branches of Petroleum
Institutions and oil field administrations are
mentioned. The problems concern improvement of
electric drilling equipment and tools, the mechanization
of control, technology and technique of drilling in
prospecting and of capital repairs. In the final
resolution, recommendation was made to invite parti-
cipation of scientific research and design
organization for further improvement.

Abstract : During the months of May, June and July, 1955, the Technical Council examined a number of questions presented by the oil producing establishments, by scientific research and project organizations of the Ministries of Petroleum and of Construction, and by various Institutes of the Academy of Sciences USSR, of the Ministry of Geology and Natural Resources, and others. A summary of those questions is given and the names of a number of institutions and of individuals are mentioned.

AUTHOR: Zlotnikov, I.

TITLE: Activities of the Technical Council of the Ministry of Petroleum Industry of the USSR (V tekhnicheskoy sovete Ministerstva neftyanoy promyshlennosti SSSR)

PERIODICAL: Neftyanoye Khozyaystvo, 1957, Nr 5, pp. 68-69 (USSR)

ABSTRACT: In the last two months of 1956 and first two months of 1957 a number of problems were reviewed by the Technical Council of the USSR Ministry of the Petroleum Industry. The Technical Council held many conferences including one in Ashkabad, held from October 26, 1956 to November 1, 1956, with representatives of various All-Union and Turkmen organizations and dealing with exploratory work for oil and gas in the Turkmen SSR, and one in Baku, held from November 26, 1956 to December 3, 1956, at which the prospect of expanding the theory and practice of hydraulic fracturing was discussed. A report covering this conference is being prepared for publication. The Technical Council's Power Section reviewed the problem of converting internal combustion engines to gas fuels and the problem of power

Activities of the Technical Council of the Ministry (Cont.)

The supply to the factories. /Synthetic Liquid Fuels Section discussed the present condition of, and the prospects for developing the process of synthesizing liquid fuels from carbon monoxide and hydrogen. The following reports were read during its November conference: "Prospects for Developing A Synthetic Process and Results of Work Done in the Fields of Synthesis by the All-Union Scientific Research Institute of the Petroleum Industry (VNII NP)" by I. B. Rapoport; "Results of Work on Synthetic Process Under Industrial Plant Conditions and the Prospect for its Further Development" by K. I. Makarov; "Technical and Economic Indices of Synthol Production Using Various Methods of Synthesis" by S. A. Feygin. The Technical Council outlined the basic direction of further work on the synthesis and made recommendations on the further development of the synthetic process. In January 1957, the Refinery Section examined standard specifications proposed by the VNII NP for Diesel oil produced from sour eastern crudes. A report of I. F. Blagovidov on this topic was discussed by representatives of seven ministries and many other scientific research organizations.

Card 2/4

Activities of the Technical Council of the Ministry 93-5-18/19
(Cont.)

The Technical Council adopted recommendations pertaining to viscosity, pour point, coking limits of Diesel lubricating oils and set up a schedule for future research and experimental work in the field of standardization of specifications. Plans for future technical publications were also discussed. N. I. Titkov reported on the use of plastic pipes for well casing and the Council resolved to have more research work done in this field. Thirty topics were discussed in 1956 by the Technical Council and several works covering these conferences have been or are about to be published. They deal with well cementing, electric drilling, reduction of the weight of the equipment used in the oil industry, chemical composition of lubricating oils and their operational properties, application of radioactive isotopes and radiation in the petroleum industry, simplification and lightening of materials and equipment in the construction of wells, and with hydraulic fracturing. The Technical Council insists on timely distribution of reports before they are delivered so that fruitful discussions can be held during conferences. The work plan of the Technical Council was discussed at various conferences and was adopted with a few modifications. This plan will be carried out provided the
